

DH Barometer: Issues and indicators

ประเทศไทย
ประกอบเวทีวิชาการ Primary care network management: M&E

18 เมษายน 2559

Background

- ▶ The District Health Barometer is a **publication that provides functional information for monitoring progress** as a means to help improve health systems organisation and delivery, and in so doing, enhance the quality of and access to primary health care.
- 

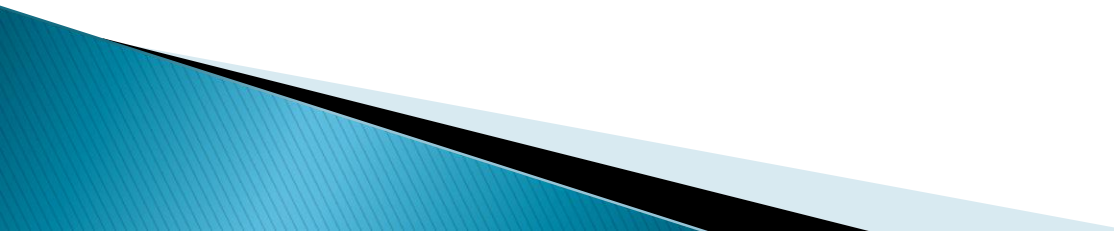

Background

- ▶ Funded by the National Department of Health, the DHB tracks, over time, important aspects of health system performance at district level.
- ▶ The content of the publication measures indicators similar to those benchmarked in district, provincial and national strategic plans, and serves a watching brief on progress against the targets set out in these plans by providing crucial quantitative input and pinpointing where serious gaps or performance issues prevail.

Highlights

- ▶ The DHB does not provide 'new' information on public health management, but packages and foregrounds key data (often overlooked in other reports and tables) from a variety of sources for health managers as the main target audience.
- ▶ Performance highlighted by presenting analysis of a carefully selected range of health indicators (from which comparisons between and among districts, and across provinces, can be made), the DHB facilitates identification of areas of poor quality requiring appropriate corrective measures.

Goals of the DHB

- ▶ To improve the **quality and transparency of health systems information** in South Africa,
 - ▶ To **build and store an authoritative and accurate database** of key health and health-related indicators
 - ▶ To **produce an annual publication of health sector performance data** covering several years, thereby enabling ongoing monitoring and evaluation
- 

Benefits

- ▶ The DHB yields a number of benefits for South Africa's health information system, and thereby for health systems more broadly, including:
 - integration of information from a number of sources into a single, accessible repository in the public domain
 - strengthening integration in the health information system
 - assisting managers at all levels to improve the quality and use of health indicators
 - providing trend data to monitor change
 - identifying gaps in data collection
 - identifying problems with information systems or data quality
 - strengthening existing information systems and the culture of information use and feedback
 - improving and developing skills in analysis and interpretation of health indicators
 - With health sector managers having endorsed the Barometer as a valuable tool, there is significant support for the publication being refined and developed in line with their current and future needs

Indicator types

- ▶ Demographic
 - Population
 - Distribution
- ▶ Socio-Economic
 - Education
 - Employment
 - Household Facilities
- ▶ Health Status
 - Mortality
 - Disability
 - Infectious Disease
 - Tuberculosis (TB)
 - Case finding
 - Case holding
 - Malaria
 - HIV Prevalence
 - HIV and AIDS

Issue and indicators

- ▶ Reproductive Health

- STIs

- Contraception and sexual behaviour

- Maternal health

- Termination of Pregnancy

- Nutrition

- Child Health

- Immunisation

- Child mortality and related

- Chronic Diseases

- Behaviour & Awareness

- Injuries

- ▶ Health Services

- Health Facilities

- Health Personnel

- Training and knowledge

- Workload

- Community Service

- Personnel per population

- Health Financing

- Health Information Systems
